
Exact model and size scope

All integer cells M ≥ 2

Physical sites L = 2M; Hilbert dimension 3^{2M}

Designated first bond coefficient = 1

Physical inverse temperature τ = β/c; c = (1+g)/2

Cell initialization 16 = 32 physical sites

Inherited D26 MPS64 anchor; one trial vector

Finite bridge M = 2…15; tail from cell16

Odd and even cell windows; closures at 256 / 512

Narrow: [19999/20001, 20001/19999], Δ ≥ .015. Wider: [12499/12501, 12501/12499], Δ ≥ .005.

Unique finite-volume ground states; direct symmetric cell kernel. No optimal-neighborhood or thermodynamic phase claim.
